PROFILE

Supply chain-focused Business Analyst with 4+ years' experience turning procurement, freight, and logistics problems into requirements development teams can build against. Comfortable running discovery with commodity managers, buyers, planners, and logistics leads, then carrying that input through gap analysis, BRD/FRD authoring, and UAT sign-off. Has taken 3+ tools from first stakeholder conversation to production across pricing/procurement automation, freight visibility, and supply-chain reporting, with a track record of cutting manual work, shortening cycle times, and surfacing measurable cost recoveries.

Technical Stack

Requirements & Delivery: Discovery workshops, BRD/FRD authoring, As-Is/To-Be gap analysis, user story writing, process mapping, UAT ownership, defect triage, stakeholder alignment, Agile/Scrum ceremonies

Domain Expertise: RFQ automation, PPV settlement & claim validation, freight sourcing and rate comparison, procurement process design, supply/demand planning, supplier OTD and risk scoring, inventory & shortage analysis, inbound/outbound logistics visibility, BOM analysis

Tools & Platforms: Advanced MS Excel, SQL basics, Zoho Sprint, Tableau

WORK HISTORY

Business Analyst | InESS Solutions, Chennai 2021 – Present

- Ran discovery sessions with commodity managers, buyers, logistics coordinators, product owners, and supply-planning contacts on the client side to map how existing processes worked, then converted those findings into BRDs, FRDs, and user stories for engineering.
- Compared current-state procurement, freight, and supply-chain processes against the systems being proposed to replace them, calling out friction points and writing up target-state requirements for several products running in parallel.
- Headed a small functional team building out automation for PPV claim validation and inventory audits spanning multiple contract-manufacturer sites, covering the validation logic and projection reporting end to end.
- Kept an eye on issues and change requests coming in after launch, working with stakeholders and developers to triage and close them out.
- Owned UAT across several product go-lives — logging defects, working fixes through with engineering, and confirming acceptance criteria were satisfied before release.
- Worked alongside the team to establish output validation checks so system results held up against business and compliance requirements.

PROJECT HIGHLIGHTS

Master Pricing Automation Tool (MPAT) — Arista Networks *(client engagement, live in production)*

Key stakeholders: commodity managers, sourcing leads, and category buyers at Arista Networks.

- Studied the existing price-comparison process and found suppliers were quoting in inconsistent formats and units, leaving buyers to normalise and compare costs by hand in spreadsheets — a slow setup prone to sourcing errors.
- Ran requirement workshops with commodity managers and sourcing leads to scope the replacement pricing engine, converting agreed business rules into a full BRD/FRD covering price normalisation, allocation logic, and cost-weighting across sourcing scenarios.

- Wrote functional specs for automatically checking supplier quotes against historical benchmarks and flagging outliers or savings opportunities for buyers to review.
- Scoped a Pricing Dashboard giving sourcing leads a live view of cost trends, price variance by supplier, and commodity-level allocation recommendations.
- Stayed close to engineering through the build to resolve allocation-logic edge cases, then ran UAT directly with commodity managers and sourcing leads, closing defects through to go-live.
- Continues to support the tool after launch, tuning allocation and cost-weighting rules as buyer feedback comes in.
- Result: replaced a manual, spreadsheet-based pricing comparison with an automated engine — sourcing decisions now run about 30% faster, and the tool is in daily use by commodity managers.

PPV Claim Validation & Global Inventory Audit Automation — Contract Manufacturers (Jabil, Foxconn)

- Led the functional workstream to automate Purchase Price Variance claim validation and global inventory audits across contract-manufacturer sites.
- Specified requirements for end-to-end claim validation, projection reporting, and automated approval routing.
- Result: cut duplicate claims and manual review effort, with automated checks surfacing roughly \$50K in discrepancies per quarter.

FreightPilot — Freight & Logistics Intelligence Platform — InESS Solutions *(internal SaaS, live in production)*

- Specified requirements for RFQ creation, a supplier quote comparison engine, and a live logistics tracker, prompted by a gap analysis showing freight data spread across PDFs, spreadsheets, and email threads.
- Ran UAT with procurement and logistics teams ahead of go-live.
- Result: replaced manual freight comparisons with a self-serve platform and shortened quote turnaround.

SaaS RFQ Management Platform — InESS Solutions *(internal product, pre-launch)*

- Scoped and documented an automated RFQ platform bringing suppliers, commodity managers, distributors, and finance into one workflow — gathering input from prospective buyer and supplier personas to shape onboarding, the supplier portal, and role-based dashboards for Admin, Supplier, and Buyer.
- Defined requirements for automated cost comparison, BOM analysis, multi-source split suggestions, and business-split/cost-up reporting for GSM managers.
- Result: projected to cut approval cycle time by roughly 50%, remove duplicate submissions, and improve supplier quote tracking; UAT wrapped with major issues resolved ahead of release.

Live Tool Support & Continuous Improvement — Arista Networks *(ongoing)*

- Supports tools already in production — logging change requests and adjusting business rules based on user feedback.

EDUCATION

B.Tech, Mechanical Engineering — SASTRA University, 2020 (CGPA 6.95)
